## JNU-ENTRANCE EXAMINATION- 2012

M.Sc. PHYSICS

Maximum Marks: 90

## INSTRUCTIONS FOR CANDIDATES

1. All questions are compulsory.
2. For each question, one and only one of the four choices given is the correct answer.
3. Each correct answer will be given +3 marks.
4. Each wrong answer will be given -1 mark.
5. Use of calculator is permitted.

Q1. The general solution of the differential equation

$$
x^{2} \frac{d^{2} y}{d x^{2}}-2 x \frac{d y}{d x}+2 y=0
$$

in terms of two arbitrary constants A and B is
(a) $e^{1 / x}\left(A \cos \left(\frac{1}{x}\right)+B \sin \left(\frac{1}{x}\right)\right)$
(b) $A x+\frac{B}{x}$
(c) $A x+B x e^{x}$
(d) $A x+B x^{2}$

Q2. If $a, b$ and $c$ are non-zero real numbers not equal to $1, \log _{a} \mathrm{c}$ can be expressed as
(a) $\log _{b} c / \log _{b} a$
(b) $\log _{b} a / \log _{b} c$
(c) $\log _{c} a / \log _{b} a$
(d) $\log _{c} b / \log _{a} b$

Q3. A homogeneous linear transformation takes the point $(1,1)$ in the $x y$-plane to the point (3, 3 ) and keeps the point ( $1,-1$ ) fixed (i.e., it remains ( $1,-1$ ) after the transformation). The matrix corresponding to this transformation is
(a) $\left(\begin{array}{ll}1 & 2 \\ 2 & 1\end{array}\right)$
(b) $\left(\begin{array}{ll}3 & 0 \\ 0 & 2\end{array}\right)$
(c) $\left(\begin{array}{ll}2 & 1 \\ 1 & 2\end{array}\right)$
(d) $\left(\begin{array}{cc}2 & -1 \\ -1 & 2\end{array}\right)$

## fiziks

Q4. The function $\frac{1}{\cosh x}$ may be expressed around the point $x=0$ as a power series as
(a) $1-\frac{1}{2} x^{2}+\frac{1}{24} x^{4}-\frac{1}{720} x^{6}+\ldots \ldots$.
(b) $1-\frac{1}{2} x^{2}+\frac{5}{24} x^{4}-\frac{61}{720} x^{6}+$. $\qquad$
(c) $1-\frac{1}{2} x^{2}+\frac{11}{24} x^{4}-\frac{331}{720} x^{6}+\ldots \ldots$.
(d) $1-\frac{1}{2 x^{2}}+\frac{1}{24 x^{4}}-\frac{1}{720 x^{6}}+\ldots \ldots$

Q5. Which of the following graphs gives the best representation of the real-valued function $y=x^{2} e^{-x^{2}}$ ?
(a)

(b)

(c)

(d)

fiziks

Q6. An observer O uses the coordinate system $(x, t)$ to describe non-relativistic motion in one dimension. Another observer $\mathrm{O}^{\prime}$, moving with respect to O with a uniform velocity $v$ (much smaller than the speed of light $c$ ) along the positive $x$-direction, uses $\left(x^{\prime}, t^{\prime}\right)$, such that at $\mathrm{t}=0, \mathrm{t}^{\prime}=0$ and that instant $x$ and $x^{\prime}$ coincide. Then
(a) $x^{\prime}=x-v t, t^{\prime}=t, \frac{\partial}{\partial x^{\prime}}=\frac{\partial}{\partial x}-\frac{1}{v} \frac{\partial}{\partial t}$ and $\frac{\partial}{\partial t^{\prime}}=\frac{\partial}{\partial t}$
(b) $x^{\prime}=x-v t, t^{\prime}=t, \frac{\partial}{\partial x^{\prime}}=\frac{\partial}{\partial x}$ and $\frac{\partial}{\partial t^{\prime}}=\frac{\partial}{\partial t}+v \frac{\partial}{\partial x}$
(c) $x^{\prime}=x+v t, t^{\prime}=t, \frac{\partial}{\partial x^{\prime}}=\frac{\partial}{\partial x}+\frac{1}{v} \frac{\partial}{\partial t}$ and $\frac{\partial}{\partial t^{\prime}}=\frac{\partial}{\partial t}$
(d) $x^{\prime}=x+v t, t^{\prime}=t, \frac{\partial}{\partial x^{\prime}}=\frac{\partial}{\partial x}$ and $\frac{\partial}{\partial t^{\prime}}=\frac{\partial}{\partial t}-v \frac{\partial}{\partial x}$

Q7. A ball dropped from a height $h$ can only attain the height $4 h / 5$ after bouncing off the floor. If the ball is dropped from a height of 1 m , the time it will take to come to rest is, approximately
[Ignore air resistance and the finite radius of the ball.]
(a) 1.9 s
(b) 3.8 s
(c) 8.0 s
(d) 4.1 s

Q8. A small raindrop of mass $m$ experiences a viscous drag force $F_{d}=b v$, proportional to its instantaneous speed $v$, If it starts from rest at a height $h$, its speed after a time $t$ is
(a) $v(t)=\frac{m g}{b} \tanh \left(\frac{b t}{m}\right)$
(b) $v(t)=\frac{m g}{b} e^{-b t / m}$
(c) $v(t)=\frac{m g}{b}\left(1-e^{-2 b t / m}\right)$
(d) $v(t)=\frac{m g}{b}\left(1-e^{-b t / m}\right)$

Q9. The nature of flow in a viscous liquid is characterised by the dimensionless Reynolds' number $R e$ proportional to $v$ (the flow velocity): $R e \propto v$. Given that $R e$ also depends on (i) the density $\rho$ of the fluid, (ii) the dynamical viscosity $\eta$ and (iii) a characteristic length $l$, of the flow. By dimensional analysis, we find that
(a) $\operatorname{Re}=\frac{\eta l v}{\rho}$
(b) $\operatorname{Re}=\frac{\rho l v}{\eta}$
(c) $\operatorname{Re}=\frac{\rho \eta v}{l}$
(d) $\operatorname{Re}=\frac{\rho v}{\eta l}$

## fiziks c/ o Anand Institute of mathematics, 28-B/ 6 Jia Sarai Near IIT, Hauz Khas, New Delhi, PIN- 110016 (INDIA)

Q10. A ball of mass $m$ is hung from a support by a massless wire of length $l$. The support is rotated with an angular speed $\Omega>\sqrt{g / l}$ around a vertical axis through the point of suspension as shown in the figure. The ball rests in equilibrium at an angle $\theta_{0}$. Which of the following statements concerning $\theta_{0}$ and the tension $T$, is true?
(a) $\theta_{0}=0$ and $T=m g$
(b) $\theta_{0}=\tan ^{-1}\left(\frac{q}{\Omega^{2} l}\right)$ and $T<m g \cos \theta_{0}$
(c) $\theta_{0}=\sin ^{-1}\left(\frac{q}{\Omega^{2} l}\right)$ and $T>m g \cos \theta_{0}$
(d) $\theta_{0}=\cos ^{-1}\left(\frac{q}{\Omega^{2} l}\right)$ and $T>m g \cos \theta_{0}$

Q11. In a wire loop of resistance $R$ and inductance $L$, an e.m.f. $\xi$ is switched on at $t=0$. The magnetic flux through the loop if given by
(a) $\frac{L \xi}{R}\left(1-e^{-t R / L}\right)$
(b) $\frac{L \xi}{R} e^{-t R / L}$
(c) $\frac{L \xi}{R}\left(1-\frac{L}{t R}\right)$
(d) $\frac{L \xi}{R}$

Q12. The electric and magnetic fields of electromagnetic fields of an electromagnetic wave in vacuum are given by $\vec{E}=\hat{i} E_{0} \sin (k z-\omega t)$ and $\vec{B}=\hat{j} B_{0} \sin (k z-\omega t)$ respectively. Which of the following relations is correct?
(a) $k^{2} E_{0}=\omega^{2} B_{0}$
(b) $\omega E_{0}=k B_{0}$
(c) $k E_{0}=\omega B_{0}$
(d) $E_{0} B_{0}=\omega k$

Q13. The radius of the nucleus of the Ra atom, which carries an electric charge +88 e , is $7.0 \times$ $10^{-15} \mathrm{~m}$. What should roughly be the speed of a proton, if it has to reach as close as $1.0 \times$ $10^{-14} \mathrm{~m}$ from the centre of the nucleus? [The radius of the cloud of orbital electrons of the Ra atom is approximately $5.0 \times 10^{-11} \mathrm{~m}$.]
(a) $6.7 \times 10^{9} \mathrm{~m} / \mathrm{s}$
(b) $3.1 \times 10^{8} \mathrm{~m} / \mathrm{s}$
(c) $1.4 \times 10^{5} \mathrm{~m} / \mathrm{s}$
(d) $4.9 \times 10^{7} \mathrm{~m} / \mathrm{s}$

## fiziks c/ o Anand Institute of mathematics, 28-B/ 6 Jia Sarai Near IIT, Hauz Khas, New Delhi, PIN- 110016 (INDIA)

fiziks

Q14. In the circuit shown below, the diode is non-ideal and has a voltage drop of 0.7 V . What is the value of the diode current?

(a) 4.84 mA
(b) 8.06 mA
(c) 3.03 mA
(d) 6.25 mA

Q15. The Doppler width $\Delta \lambda$ of the orange line (for which $\lambda=6058 \AA$ ) of Kr is $0.0055 \AA$. What is the spread in frequency of this spectral line?
(a) $2.7 \times 10^{7} \mathrm{~Hz}$
(b) $2.7 \times 10^{9} \mathrm{~Hz}$
(c) $4.5 \times 10^{6} \mathrm{~Hz}$
(d) $4.5 \times 10^{8} \mathrm{~Hz}$

Q16. A beam of light, consisting of red (R), green (G) and blue (B) colours, is incident normal to a face on a right-angled prism (see figure). The refractive indices of the material of the prism for R, G and B wavelengths are 1.39, 1.44 and 1.47 respectively. Then

(a) R, G and B get transmitted (without undergoing total internal reflection)
(b) R and G undergo total internal reflection and B gets transmitted
(c) R gets transmitted, while $G$ and $B$ undergo total internal reflection
(d) All of R, G and B undergo total internal reflection

Q17. The two slits in a Young's double-slit experiment are of unequal width, one being four time wider than the other. If $I_{\max }$ and $I_{\min }$ denote the intensities at a neighbouring maximum and a minimum, then the ratio $I_{\text {min }} / I_{\max }$ is
(a) $\frac{1}{9}$
(b) $\frac{1}{4}$
(c) $\frac{3}{5}$
(d) 0
fiziks

Q18. A linear beam of unpolarised light passes through two plane polarisers, the planes of which are perpendicular to the direction of propagation of the beam. The first polariser rotates around this direction with an angular velocity of $20 \pi$ radians per second. If the initial intensity of the light beam is $I_{0}$, then the intensity when it leaves the second polariser

(a) is periodic with frequency of 20 Hz and maximum of $I_{0} / 4$
(b) is periodic with frequency of 20 Hz and maximum of $I_{0} / 2$
(c) is periodic with frequency of 10 Hz and maximum of $I_{0} / 4$
(d) is periodic with frequency of 10 Hz and maximum of $I_{0} / 2$

Q19. The Boolean expression $B \cdot(A+B)+A \cdot(A+\bar{B})$ can be realised using a minimum number of
(a) 1 OR gate
(b) 1 AND gate
(c) 2 OR gate
(d) 2 AND gate

Q20. An ideal diatomic gas (of $\gamma=5 / 3$ ) is expanded adiabatically so that its volume is doubled. By what ratio is its temperature reduced in this process?
(a) $1 / 2$
(b) $1 / 2^{1 / 3}$
(c) $1 / 2^{2 / 3}$
(d) $1 / 2^{5 / 3}$

Q21. Two buckets $B_{1}$ and $B_{2}$, each containing 25 litres of water, are initially at temperatures $T_{1}$ and $T_{2}$, respectively. Now take 1 litre of water from $B_{1}$, put it in $B_{2}$ and allow thermal equilibrium to be established. Then take 1 litre of water from $B_{2}$, put it back in $B_{1}$ and again allow it to come to thermal equilibrium. At the end of this cycle the amount of water in each bucket does not change, but their temperatures will change. When this process is repeated, the difference in temperature reduces by the same factor after each cycle. If $\left|T_{1}-T_{2}\right|$ was $40^{\circ} \mathrm{C}$ to begin with, what would be its value after 5 cycle?
(a) $27^{\circ} \mathrm{C}$
(b) $10^{\circ} \mathrm{C}$
(c) $19^{\circ} \mathrm{C}$
(d) $35^{\circ} \mathrm{C}$
fiziks

Q22. A flat plate is constantly being bombarded from one side by particles of mass $m$. If the number density of the particles is $\rho$ and they strike the plate with speed $v$ along the normal to the plate, the pressure exerted on the plate is
(a) $m \rho v^{2}$
(b) $2 m \rho v^{2}$
(c) $m \rho v$
(d) $2 m \rho v$

Q23. Helium atoms at low temperatures make a perfect closed pack structure of hexagonal lattice with parameters $\mathrm{a}=0.36 \mathrm{~nm}$ and $\mathrm{c}=0.59 \mathrm{~nm}$. The density of the crystal is approximately
(a) $2000 \mathrm{~kg} / \mathrm{m}^{3}$
(b) $100 \mathrm{~kg} / \mathrm{m}^{3}$
(c) $123 \mathrm{~kg} / \mathrm{m}^{3}$
(d) $200 \mathrm{~kg} / \mathrm{m}^{3}$

Q24. The ratio of the specific heat capacity and temperature, $C_{\checkmark} / T$, of Cu is plotted as a function of $T^{2}$, the square of the absolute temperature, in the graph below:

The values of $\gamma$ and $\beta$ (the coefficients corresponding to the electronic and the vibrational components of the specific heat) are, approximately
(a) $\gamma=7.0 \times 10^{-4} \mathrm{~J} \mathrm{~mol}^{-1}$ and $\beta=5.0 \times 10^{-5} \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-4}$
(b) $\gamma=5.0 \times 10^{-5} \mathrm{~J} \mathrm{~mol}^{-1}$ and $\beta=7.0 \times 10^{-4} \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-4}$
(c) $\gamma=1.4 \times 10^{-3} \mathrm{~J} \mathrm{~mol}^{-1}$ and $\beta=7.0 \times 10^{-4} \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-4}$
(d) $\gamma=5.0 \times 10^{-4} \mathrm{~J} \mathrm{~mol}^{-1}$ and $\beta=7.0 \times 10^{-5} \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-4}$

fiziks

Q25. A paramagnetic gas at room temperature is placed in an external magnetic field of 1.5 T (tesla). Each atom of the gas has a magnetic moment $\mu=1.0 \mu_{B}$, where $\quad \mu_{B}=9.3 \times$ $10^{-24} \mathrm{~J} / \mathrm{T}$ is the Bohr magneton. The difference in energy when an atom is aligned along the magnetic field and opposite to it, is
(a) $2.8 \times 10^{-23} \mathrm{~J}$
(b) $1.4 \times 10^{-23} \mathrm{~J}$
(c) $18.6 \times 10^{-24} \mathrm{~J}$
(d) $9.3 \times 10^{-24} \mathrm{~J}$

Q26. The Fermi energy $\varepsilon_{F}$ in metals depends on the number density $n_{e}$ of mobile electrons, which may be thought of as a free Fermi gas. If $n_{e}$ of one metal is larger by a factor of 1000 compared to another, then in comparison, its Fermi energy is
(a) 1000 times larger
(b) smaller by a factor of $1 / 100$
(c) 100 times larger
(d) 10 times larger

Q27. The kinetic energy of a proton and an $\alpha$-particle (not under the influence of any force) are given to be equal. If we denote the de Broglie wavelengths of the proton by $\lambda_{p}$ and that of the $\alpha$-particle by $\lambda_{\alpha}$, then
(a) $\lambda_{p} \approx \lambda_{\alpha}$
(b) $\lambda_{p} \approx 4 \lambda_{\alpha}$
(c) $\lambda_{p} \approx 1 / 2 \lambda_{\alpha}$
(d) $\lambda_{p} \approx 2 \lambda_{\alpha}$

Q28. When a monochromatic point source of light is placed at a distance of 0.2 m from a photoelectric cell, the stopping potential $V_{s}$ and the saturation current $I_{s}$ are found to be 0.6 V and 18.0 mA , respectively. If the same source is now placed 0.6 m away from the photoelectric cell, one finds
(a) $V_{s}=0.2 \mathrm{~V}$ and $I_{s}=6.0 \mathrm{~mA}$
(b) $V_{s}=0.6 \mathrm{~V}$ and $I_{s}=6.0 \mathrm{~mA}$
(c) $V_{s}=0.6 \mathrm{~V}$ and $I_{s}=2.0 \mathrm{~mA}$
(d) $V_{s}=0.2 \mathrm{~V}$ and $I_{s}=18.0 \mathrm{~mA}$

fiziks
t!ミ!k2

Q29. The graph in the figure below shows the intensity $I$ as a function of frequency $v$ of a perfect blackbody at a fixed temperature T :

The corresponding graph at temperature 2 T can be obtained by which of the following operations?

For every point of the graph
(a) multiply the $v$-coordinate by $1 / 2$ and the $I$-coordinate by 8
(b) multiply the $v$-coordinate by 2 and the $I$-coordinate by 8
(c) multiply the $v$-coordinate by $1 / 2$ and the $I$-coordinate by 16
(d) multiply the $v$-coordinate by 2 and the $I$-coordinate by 16

Q30. What is the maximum theoretical accuracy $\Delta E$ to which an ideal experiment may determine the energy levels of the hydrogen atom?
[Hint: Use the fact that the age of the universe is estimated to be approximately $\times 10^{10}$ years.]
(a) $4.7 \times 10^{-26} \mathrm{eV}$
(b) $9.4 \times 10^{-33} \mathrm{eV}$
(c) $1.2 \times 10^{-63} \mathrm{eV}$
(d) $2.4 \times 10^{-70} \mathrm{eV}$
fiziks

Q31. A particle in one dimension is in the ground state (lowest energy quantum state) of the potential well given by

$$
V(x)= \begin{cases}0 & \text { for }|x|<\frac{L}{2} \\ \infty & \text { otherwise }\end{cases}
$$

Let $P_{+}$be the probability that the particle is found to move along the positive
$x$ direction and $p$ be the magnitude of the momentum for that state of motion. Then
(a) $P_{+}=0$ and $p=0$
(b) $P_{+}=\frac{1}{2}$ and $p=\frac{\pi}{2 L}$
(c) $P_{+}=\frac{1}{2}$ and $p=\frac{\pi}{L}$
(d) $P_{+}=1$ and $p=\frac{\pi}{L}$

Q32. A particle of mass $m$ is moving in a three-dimensional potential

$$
V(x, y, z)=\frac{1}{2} m \omega^{2}\left(x^{2}+2 y^{2}+4 z^{2}\right)
$$

The energy of the particle in the ground state (lowest energy quantum state) is
(a) $\frac{\sqrt{7}}{2} \hbar \omega$
(b) $\frac{3}{2} \hbar \omega$
(c) $\frac{7}{2} \hbar \omega$
(d) $\frac{(3+\sqrt{2})}{2} \hbar \omega$

Q33. A nucleus may be modelled as a drop of liquid consisting of the nucleons (protons and neutrons). In this model, the dominant contribution to the nuclear binding energy is from the volume, which is proportional to $A$, the total number of nucleons. Then the two important subdominant contributions from the surface tension and the Coulomb repulsion of the protons are, proportional to
(a) $A^{2 / 3}$ and $Z / A^{1 / 3}$ respectively
(b) $A^{2 / 3}$ and $Z^{2} / A^{1 / 3}$ respectively
(c) $A^{1 / 3}$ and $Z^{2} / A^{2 / 3}$ respectively
(d) $A^{1 / 2}$ and $Z^{2} / A^{1 / 3}$ respectively

## fiziks c/ o Anand Institute of mathematics, 28-B/ 6 Jia Sarai Near IIT, Hauz Khas, New Delhi, PIN- 110016 (INDIA)
