

**COCHIN UNIVERSITY OF SCIENCE
AND TECHNOLOGY**

DEPARTMENT OF APPLIED CHEMISTRY

SYLLABUS FOR M.Sc. CHEMISTRY
(WITH EFFECT FROM 2015-16)

DEPARTMENT OF APPLIED CHEMISTRY

M.Sc. CHEMISTRY
COURSE STRUCTURE AND SYLLABUS
(WEF 2015-16)

SEMESTER I

Course	Core/Elective	Credits	Marks		Total marks
			Internal	End semester	
CHE 2101 Inorganic Chemistry-I	Core	3	50	50	100
CHE 2102 Organic Chemistry-I (Structure & Reactivity)	Core	3	50	50	100
CHE 2103 Physical Chemistry-I	Core	3	50	50	100
CHE 2104 Group Theory and Spectroscopy	Core	3	50	50	100
CHE 2105 Inorganic Chemistry Lab	Core	2	100	-	100
CHE 2106 Physical Chemistry- Equilibrium Thermodynamics	Elective	2	50	50	100
CHE 2107 Stereochemistry -I	Elective	2	50	50	100
CHE 2108 Nuclear Chemistry	Elective	2	50	50	100
CHE 2109 Environmental Chemistry	Elective	2	50	50	100
CHE 2110 Chemistry of Polymers	Elective	2	50	50	100
CHE 2111 Spectroscopy	Interdepartmental Elective	2	50	50	100

SEMESTER II

Course	Core/Elective	Credits	Marks		Total marks
			Internal	End semester	
CHE 2201 Analytical Chemistry	Core	2	50	50	100
CHE 2202 Inorganic Chemistry-II	Core	3	50	50	100
CHE 2203 Organic Chemistry-II (<i>Reactions & Mechanisms</i>)	Core	2	50	50	100
CHE 2204 Organic Chemistry-III (<i>Reagents & Synthesis</i>)	Core	2	50	50	100
CHE 2205 Physical Chemistry-II	Core	3	50	50	100
CHE 2206 Organic Spectroscopy	Core	2	50	50	100
CHE 2207 Organic Chemistry Lab	Core	2	100	-	100
CHE 2208 Introduction to Materials Chemistry	Elective	2	50	50	100
CHE 2209 Stereochemistry - II	Elective	2	50	50	100
CHE 2210 Crystallography	Elective	2	50	50	100
CHE 2211 Bioanalytical Chemistry	Elective	2	50	50	100
CHE2212 Medicinal Chemistry	Elective	2	50	50	100
CHE 2213 Chemical Instrumentation	Interdepartmental Elective	2	50	50	100

SEMESTER III

Course	Core/Elective	Credits	Marks		Total marks
			Internal	End semester	
CHE 2301 Instrumental Methods of Analysis	Core	2	50	50	100
CHE 2302 Inorganic Chemistry-III	Core	3	50	50	100
CHE 2303 Organic Chemistry-IV (Natural Products)	Core	4	50	50	100
CHE 2304 Physical Chemistry-III	Core	3	50	50	100
CHE 2305 Physical Chemistry Lab	Core	2	100	–	100
CHE 2306 Solid state Chemistry	Elective	2	50	50	100
CHE 2307 Industrial Catalysis	Elective	2	50	50	100
CHE 2308 Microbial Technology	Elective	2	50	50	100
CHE 2309 Advanced Photochemistry	Elective	2	50	50	100
CHE 2310 Introduction to Computational Chemistry	Elective	2	50	50	100
CHE 2311 Polymer Technology	Elective	2	50	50	100
CHE 2312 Chemistry of Carbohydrates	Elective	2	50	50	100

SEMESTER IV

Course	Core/Elective	Credits	Marks		Total marks
			Internal	End semester	
CHE 2401 Dissertation	Core	16	150	150	300
CHE 2402 Viva	Core	-	50	50	100

CORE

CHE 2101 Inorganic Chemistry-I

(3 Credit)

48 Hours

Unit 1

Structure and bonding in polyhedral boranes and carboranes, styx notation; electron count in polyhedral boranes; Wade's rule; topological approach to boron hydride structure. Styx numbers. Importance of icosahedral framework of boron atoms in boron chemistry. Closo, nido and arachno structures. synthesis of polyhedral boranes; Carboranes Metallocarboranes. boron halides; phosphine-boranes; boron heterocycles; borazine.

Unit 2

Sulphur-Nitrogen compounds: Tetrasulphur tetranitride, disulphur dinitride and polythiazyl. S_xN_y compounds. S-N cations and anions. Sulphur-phosphorus compounds: Molecular sulphides such as P_4S_3 , P_4S_7 , P_4S_9 and P_4S_{10} . Phosphorus-nitrogen compounds: Phosphazenes. Cyclo and linear phosphazenes.

Unit 3

Silanes, silicon halides, silicates, silicones, silanols; germanium, tin and lead organyls; silenes, germenes and stannenes; fullerenes; carbon nanotubes (CNT's) and graphenes ultramarines and zeolites

Unit 4

Relative strength of acids, Pauling rules, Lux-Flood concept, Lewis concept, Measurement of acid base strength systematic of Lewis acid-base interactions steric and solvation effects acid-base anomalies, Pearson's HSAB concept, acid-base strength and hardness and softness, Symbiosis, theoretical basis of hardness and softness, electronegativity and hardness.

Chemistry in non aqueous solvents reactions in NH_3 , liquid SO_2 , solvent character, reactions in SO_2 , acetic acid, solvent character, reactions in CH_3COOH and some other

solvents. Molten salts as non aqueous solvents solvent properties room temperature molten salts. unreactivity of molten salts, solutions of metals.

Unit 5

Macrocycles and supramolecules non-covalent forces and interactions in supramolecules, crown ethers, cryptates, cryptands, carcerands, calixarenes, cyclodextrins, fullerenes, dendrimers, rotaxanes, cucurbiturils, self-assembly and preorganization, coordination driven self-assembly of supramolecular two and three dimensional architectures, host-guest chemistry, metal-organic frameworks and their applications.

CHE 2102 Organic Chemistry - I
(Structure & Reactivity)
(3 Credits)

48 Hours

Unit 1

Structure and Models of bonding: Study of different bonding models with emphasis on understanding three dimensional structure of molecules. Bonding weaker than covalent bonds: ion pairing interactions: ion - dipole interactions, dipole - dipole interactions, hydrogen bonding, factors affecting the strength of hydrogen bonds, cation-pi interaction, polar-pi interaction, pi stacking, pi donor-acceptor interactions. Hydrophobic effect, Concept of supramolecular chemistry.

Unit 2

MOT and structures of organic molecules: Qualitative MOT. Group Orbitals of Methyl and Methylene groups. MO's of Methane, ethane, propane, methyl halides, ethylene, formaldehyde, conjugated systems: 1,3-butadiene, allyl radical, cation and anion. Structure and stability of reactive intermediates: carbocations, carbanions, radicals, carbenes and nitrenes (excluding reactions and synthetic applications). Baldwin ring-closure rules.

Effects of pi conjugation: alkene, anion, cation and radical stabilizing groups, Hyperconjugation: effects of hyperconjugation with C-H bonds, C=C, lone pairs, cations, negative hyperconjugation, anomeric effect. Huckel's rule and modern theory of aromaticity. Study of [n]annulenes, fullerenes, nonbenzenoid aromatics.

Unit 3

Classification of reactions according to IUPAC conventions. Reaction mechanism: guidelines on Pushing of electrons.

Methods of determining reaction mechanisms (kinetic and non kinetic methods): The Hammond postulate, reactivity vs selectivity principle, the Curtin-Hammett principle, microscopic reversibility, kinetic vs thermodynamic control. Isotope effects.

Carbon acids: pK_a of weak acids, Effect of structure on acidity and basicity. Linear free energy relationships: Hammett and Taft parameters, Solvent effects (Grunwald-Winstein plots and Schleyer adaptation), nucleophilicity and nucleofugality. Other Experimental techniques to determine reaction mechanisms: identification of intermediates by trapping and competition experiments, cross - over experiments, isotope scrambling, radical clocks and traps, matrix isolation.

Unit 4

Frontier Orbitals, HSAB concept, Perturbation theory of reactivity. Application of Frontier Orbital theory in studying ionic reactions: aliphatic nucleophilic substitution reactions, Ambident nucleophiles, Ambident electrophiles, α -effect. Application of Frontier Orbital theory in studying radical reactions.

Unit 5

Pericyclic reactions, study of the principle of conservation of orbital symmetry: Orbital symmetry diagrams for cycloaddition and electrocyclic reactions, Study of Frontier Molecular Orbital Theory, Aromatic Transition State Theory and The Generalized Woodward – Hoffmann rule applied to cycloadditions, electrocyclic reactions, sigmatropic rearrangements and chelotropic reactions– Stereochemistry and regiochemistry of cycloadditions. Substituent and medium effects, secondary orbital interactions in [4+2] cycloadditions. Intramolecular Diels–Alder reactions. 1,3-dipolar cycloaddition reactions. Photochromism and thermochromism, Cope rearrangement, Claisen rearrangement, and ene-reaction.

CORE

CHE 2103 Physical Chemistry I
(3 Credit)

48 Hours

Unit 1 Quantum Chemistry 1

Postulates of Quantum Mechanics. Time dependent and time independent Schrodinger wave equation. Conservative systems, Stationary states, Formulation of quantum mechanical problems, Application of Schrodinger wave equation for particle in one dimensional box, Particle in three dimensional box (rectangular and cubical), Separation of variables, concept of degeneracy, Introduction to quantum mechanical tunneling

Unit 2 Quantum Chemistry 2

Vibrational motion, Harmonic oscillator, Method of power series, Hermite equation and Hermite Polynomials, Recursion formula, Rodrigues formula, wave function and energy . Rigid rotator, Wave function in spherical polar coordinates, Planar rotator, phi equation, wave functions in real forms, Polar diagrams, Nonplanar rotator, Theta equation and solutions Lagendre equation and Lagendre polynomials, Spherical harmonics, Angular momentum operator L^2 and L_z , Space quantization. H atom, the R equation, Laguerre equation and Laguerre polynomials wave equation and energy of H like systems, Radial function and radial distribution functions, Shapes of s, p, d and f atomic orbitals.

Unit 3 Quantum Chemistry 3

Postulate of electron spin - orbital and spin functions. Many electron atoms. Approximation methods: Variation theorem and its proof, application to particle in one dimensional box, Helium atom. Perturbation method, First order perturbation, Application to helium atom, Hartree Fock Self Consistent Field method, Slater's treatment of complex atoms, Slater orbitals. Pauli principle, Slater determinant and wave function.

Unit 4 Quantum chemistry 4

Chemical bonding, Born Oppenheimer approximation, Molecular orbital method for diatomic molecules, Correlation diagram, Non-crossing rule. Valence bond method. Comparison of VB and MO method, Bonding in simple molecules like water, BF₃, NH₃ CH₄, VSEPR theory, Pi bonding in simple molecules. HMO method for linear conjugated hydrocarbons, aromatic hydrocarbons, calculation of free valence charge density and reactivity.

Unit 5 Electrochemistry 1

Activity and Activity coefficient of electrolytes, ionic strength, Debye Huckel theory of strong electrolytes . Debye Huckel limiting law, Mean ionic activity coefficient. Application of Debye Huckel theory to conductance behaviour, Relaxation and electrophoretic effect, Debye-Huckel-Onsager equation and its derivation. Debye Falkenhagen effect . Wien effect.

Unit 6 Electrochemistry 2

Equilibrium Electrochemistry, EMF Phenomena, Cell Potential and its measurement, reference electrodes. Calculation of thermodynamic properties and activities. Cells without liquid junction potential. Liquid junction potential and its determination. Determination of solubility. pH Conductometric, Potentiometric and pH titrations, Redox indicators and redox titrations. Dynamic Electrochemistry, Electrical double layer, Various models of electrical double layer, Electrode polarization. Overpotential and its theories, Butler Volmer equation, Tafel equation. Tafel plot and its significance Corrosion and methods for prevention. Pourbaix diagram and Evans diagrams. Storage cells, Lead acid battery, Lithium battery, nickel cadmium cell. Fuel Cell. Theory and working of fuel cell. H₂- O₂ fuel cell, methanol fuel cell, Solid oxide fuel cells.

CORE

CHE 2104 Group Theory & Spectroscopy

(3 Credit)

48 hours

Unit- 1

Molecular symmetry: Symmetry elements and operations, Point groups, Matrix representation of symmetry operations, character, Application of Group theory to symmetry properties of molecules, Definition of a mathematical group, Abelian group, cyclic group, symmetry operations as group elements, similarity transformation and classes Group multiplication table – Symmetry classification of molecules into point groups (Schoenflies symbol)- Application of symmetry to predict polar and chiral compounds.

Unit- 2

Reducible and Irreducible representations - Great Orthogonality theorem and its consequences (statement only, proof not needed), Character tables- reduction formula- Construction of character tables for point groups with order ≤ 6 - Interpretation of character tables. Wave functions as bases for irreducible representations, Construction of hybrid orbitals for AB_3 (planar), AB_4 (Td), AB_5 (D_{3h}) and AB_6 (Oh) type of molecules - Symmetry adapted linear combinations, Projection operators, Application of projection operators to pi-bonding in ethylene, cyclopropenyl systems and benzene.

Unit 3

Nature of electromagnetic radiation, its interaction with matter, intensity and width of spectral lines, Classical and quantum chemical approach to absorption of radiation by molecules. Energy levels in molecules. Population of energy levels. Induced quantum transitions. Integrated absorption coefficient. Einstein's coefficients of absorption. Basis of selection rules, transition moment integral. Beer's Law. Induced absorption and emission of radiation by molecules.

Unit 4

Rotational and vibrational energies of diatomic molecules. Linear molecules. Symmetric top and asymmetric top molecules. Rotation spectra: Diatomic and polyatomic molecules. Vibration spectra of diatomic molecules, rotational character of vibration spectra. Coupling of rotation and vibration. Parallel and perpendicular bands. Morse potential of real molecules, overtones and combination, Fermi resonance.

Vibration spectra of polyatomic molecules, Normal modes of vibrations of polyatomic molecules. Raman Spectroscopy. Rotational Raman spectra. Vibrational Raman spectra, Surface enhanced Raman spectra, Resonance Raman, mutual exclusion principle. Applications of Group theory for molecular vibrations, The Characters for the Reducible Representation of Molecular Motion. The Symmetry of Group Vibrations. Selection rules and applications to IR and Raman spectra.

Fourier Transformation in IR spectroscopy, ATR. Temperature effects. Solid state spectroscopy. Diffuse reflectance spectroscopy.

Unit 5

Electronic energy states of molecules. Vibrational structure of electronic bands. Electronic transitions and absorption bands. Electronic spectra of diatomic and polyatomic molecules, its relation to electronic arrangement and symmetry of molecules. Different types of electronic transitions, Applications of group theory in electronic spectra, Electronic spectra of conjugated systems. Electronic spectra of coordination compounds.

Unit 6

Magnetic resonance spectroscopy : Theory of nuclear magnetic resonance, Chemical shifts, relaxation effects. Fourier Transformation in NMR, Measurement of relaxation time, Spin echo, NOE, 2D NMR. Electron spin resonance and applications. NQR Spectroscopy. MRI, Solid state NMR.

CHE 2105 Inorganic Chemistry Lab**(2 Credit)**

Reactions of titanium, vanadium, chromium, manganese, iron, cobalt, nickel and copper ions. Reactions of some less common metal ions (Tl, W, Mo, V, Zr, Th, U). The spot test technique for metal ions. Semimicro qualitative analysis of common and rare cations in a mixture. Ion exchange separations (Zn^{2+} , Mg^{2+}). Solvent extraction (Fe). An open-ended experiment involving analysis (e.g., Double salt formation and ion-exchange separation of oxidation states).

Estimation of metal ions by complexometric and cerimetric titrations. Estimation of Mg, Ca, Mn, hardness of water.

Synthesis of inorganic complexes and their characterization by various physicochemical methods, such as IR, UV, Visible, NMR, magnetic susceptibility etc. Selection can be made from the following or any other complexes for which references are available in the literature

Tris(oxalato)manganese(III)

Tetrapyridinesilver(II)peroxodisulphate

Tris(acetylacetonato) iron(III)

Bis(N,N-diethyldithiocarbamate)nitrosyliron(I)

Optical isomers of tris(ethylenediamine)cobalt(III)chloride

Nitropentamminecobalt(III) chloride

Nitritopentamminecobalt(III) chloride

Tri(acetylacetonato)manganese(III)

Tris(thiourea) copper(I) sulphate

Phenyl lithium

Tetraphenyl lead

Ferrocene

Phosphonitrilic chloride

Anhydrous copper(II) nitrate

Interpretation of its electronic spectrum and calculation of Dq values

Determination of crystal field splitting energy for certain ligands and construction of a part of the spectrochemical series

Methods for obtaining single crystals and checking the suitability of the crystals for single crystal determination.

Cobalt (II) bromide catalyzed oxidation of p-xylene

CHE 2106 Physical Chemistry-Equilibrium Thermodynamics

(2 Credit)

32 hours

Unit 1

Mathematical techniques: Variables of thermodynamics, theoretical methods, Practical techniques. First law of thermodynamics, thermodynamic functions, heat capacity, thermochemistry. Joule Thomson effect. Coefficient of thermal expansion and compressibility factor.

Unit 2

Second law of thermodynamics. Entropy. The Clausius inequality. Entropy changes accompanying expansion, phase transition and heating. free energy functions. Third law of thermodynamics: Need for third law Calculation of absolute entropy, unattainability of absolute zero. Relation between thermo dynamic functions. Maxwell relations. Variation of entropy with temperature and pressure.

Unit 3

Thermodynamic systems of variable composition. Fugacity functions. Partial molar quantities; Gibbs-Duhem equations. Duhem-Margules equations. Henry's law, Rault's law. Thermodynamics of ideal solutions, real solution and regular solutions. Dilute solutions of nonelectrolytes, Activity and standard states of nonelectrolytes,

Unit 4

Phase rule – Application to one, two and three component systems. Liquid-vapour equilibria of binary systems.

Unit 5

Applications of free energy function to physical and chemical changes. Equilibrium in chemical reactions. effect of temperature and pressure on chemical equilibrium- Van't Hoff reaction isochore and isotherm

ELECTIVE

CHE 2107 Stereochemistry I

(2 Credit)

32 Hours

Unit 1

Geometrical isomerism, origin – structural features including C-C and C-hetero atom double bonds, cyclic systems and other systems exhibiting restricted rotation, different nomenclature including, *cis-trans*, *E-Z*, *syn-anti*, *endo-exo*, *in-out*, relative acidity of maleic and fumaric acids.

Unit 2

Optical isomerism, origin of chirality, chiral centres, axes and planes, helicity, enantiotopic and diastereotopic atoms, groups and faces, prochiral centres and faces, allenes, cumulenes, biphenyls, and spirans. Compounds containing chiral atoms other than carbon.

Unit 3

Conformational analysis, Acyclic sp^3-sp^3 , sp^3-sp^2 systems, structure and stability of small, medium, and large rings, cyclohexane, substituted cyclohexanes, *A* values, cyclohexenes, decalins, bicyclic systems. Strain, types of strain including *B*, *F*, *I*, Pitzer strain, Beyer strain.

Unit 4

Conformation and Stereo-electronic Effects of carbohydrates: *D* and *L* sugars, Chair conformation, Endo/Exo-anomeric effect, Reverse anomeric effect, Glycosidic torsion angles, Hydroxymethyl group conformation. Conformation and stability of aldohexoses, structure and conformation of ribose and deoxyribose.

Unit 5

Brief introduction to CD and ORD techniques, octant rule, axial haloketone rule, and sign of Cotton effect (*Note*: determination of structure and stereochemistry will not be covered in this introductory course).

ELECTIVE

CHE 2108 Nuclear Chemistry (2 Credit)

32 Hours

Unit 1

Radius of atomic nuclei: binding energy of nuclei, force between nucleons. Nuclear moment: nuclear angular momentum, nuclear magnetic dipole moment, electronic quadrupole moment – NQR Nuclear models: liquid drop model, nuclear shell model, fermi gas model. The subatomic particles: electron, proton, neutron, antiproton, positron, meson, quarks. Mass of nuclei: isotopes, isobars, mass spectrometry- identification of isotopes.

Unit 2

General characteristics of radioactive decay, parent-daughter decay growth relationships Decay kinetics, artificial transmutation and artificial radioactivity, nuclear stability and nuclear binding energy, packing fraction.

Unit 3

Types of nuclear reactions: react ion cross sect ion-compound nucleus theory, high energy nuclear, direct nuclear, photonuclear and thermonuclear react ions. Source of nuclear bombarding particles: Charged particle accelerators, gamma ray, X-ray and neutron sources. Fission: Fission products and Fission yield curve, Fission energy, theory of nuclear fission, nuclear reactor, breeder reactor - nuclear reactors in India. Fusion reactions, hydrogen bomb and energy of sun.

Unit 4

Transuranium elements: Synthesis, separation and properties of transuranium elements. Reprocessing of spent fuels. Solvent Extraction - Specific sequestering agents for transuranium elements.

Unit 5

Radio isotopes: Co-precipitation, ion-exchange, solvent extract ion - as a tracer, Synthesis of labeled compounds (any two), isotopic dilution and radiopharmaceuticals. Neutron activation analysis, positron annihilation and autoradiography. Dating of objects and mechanistic study. Radio isotopes: Co-precipitation, ion-exchange, solvent extraction - as a tracer, Synthesis of labeled compounds (any two), isotopic dilution and radiopharmaceuticals. Neutron activation analysis, positron annihilation and autoradiography.

Principles of determination of age of rocks and minerals, radio carbon dating principles, Isotope dilution and neutron activation analysis.

ELECTIVE

CHE 2109 ENVIRONMENTAL CHEMISTRY

(2 Credit)

32 Hours

Unit 1

Global warming – Ozone hole. Environmental segments – The hydrological cycle – The oxygen cycle – The nitrogen cycle – The sulphur cycle – Composition of atmosphere – Earth's radiation balance – Green house effect.

Unit 2

Air pollution – Primary pollutants, Acid rain – Air quality standards – Sampling – Monitoring – Analysis of CO, nitrogen oxides, sulphur oxides, hydrocarbons and particulate matter – Control of air pollution.

Unit 3

Soil pollution – Inorganic and organic components in soil – Acid – Base and ion exchange reactions in soils – Micro and macro nutrients – Wastes and pollutants in soil.

Unit 4

Water pollution – Water pollutants – Eutrophication – Water quality criteria for domestic and industrial uses – Trace elements in water – Determination of quality parameters – Total hardness, TDS, pH, chloride, heavy metals, etc.

Principles of water and waste water treatment – Aerobic and anaerobic treatment – Industrial waste water treatment – Removal of organic and inorganic materials from water and waste water.

Unit 5

Instrumental techniques in environmental analysis – Use of neutron activation analysis – ASV, AAS, GC, HPLC, ion selective electrodes and ion chromatography in environmental chemical analysis.

ELECTIVE

CHE 2110 CHEMISTRY OF POLYMERS

(2 Credit)

32 Hours

Unit 1

History of Polymer Science. Concept of macromolecules, Principle of duality, Integration of molecular character and material character. Molecular design, synthesis and process technologies. Nomenclature and Classification. Raw Material sources of polymers. Natural gas, coal and petroleum. Monomers and polymers derived from natural gas. Petroleum and petrochemicals. Monomers and polymers derived from ethylene and propylene. Monomers and polymers derived from C4 and C5 Systems and BTX fraction. Acetylene as a source of monomers.

Unit 2

Polymerization processes. Free radical addition polymerization. Kinetics and mechanism. Chain transfer. Molecular weight distribution and molecular weight control. Cationic and anionic polymerization. Polymerization without termination. Living polymers. Step Growth polymerization. Kinetics and mechanism. Linear Vs cyclic polymerization, Group Transfer, metathesis and ring opening polymerization. Copolymerization. The copolymerization equation, Q-e scheme, Gelation and Crosslinking. Copolymer composition drift. Polymerization techniques. Bulk Solution, melt, suspension, emulsion and dispersion techniques.

Unit 3

Polymer Stereochemistry. Organizational features of polymer chains. Configuration and conformation, Tacticity, Repeating units with more than one asymmetric center. Chiral polymers – main chain and side chain. Stereoregular polymers. Manipulation of polymerization processes. Zeigler-Natta and Kaminsky routes. Coordination polymerization. Metallocene and Metal oxide catalysts.

Unit 4

Polymer Characterization. Molecular weights. Concept of average molecular weights, Determination of molecular weights. GPC and Light scattering techniques. Molecular weight distribution. Crystalline and amorphous states. Glassy and Rubbery States. Glass transition and crystalline melting. Spherulites and Lammellae. Degree of Crystallinity, Thermal analysis of polymers. TG/DTG, DTA/DSC, Spectroscopy of polymers. Microstructure determination by IR, Raman, UV, NMR and MS techniques. Solid State NMR and polymer stereochemistry.

Unit 5

Industrial polymers. Synthesis, Structure and applications. Polyethylene, polypropylene, polystyrene. PVC, PVA, PAN, PA. Poly(vinyl carbazole), poly(vinyl imidazole). PMMA and related polymers. Fluorine containing polymers. Reaction polymers. Polyamides, polyesters. Epoxides, polyurethanes, polycarbonates, phenolics, PEEK, Silicone polymers. Reactions of polymers. Polymers as aids in Organic Synthesis. Polymeric Reagents, Catalysts, Substrates, Liquid Crystalline polymers. Main chain and side chain liquid crystalline polymers.

ELECTIVE(INTERDEPARTMENTAL)

CHE 2111 SPECTROSCOPIC TECHNIQUES (2 Credit)

Unit 1

Spectroscopy as a physical property of molecules, different regions of electromagnetic spectrum and energy associated with a particular frequency, basics of light absorption, factors affecting sensitivity, absorption characteristics, structural information based on absorption characteristics.

Unit 2

UV-visible spectroscopy – allowed and forbidden transitions, chromophores, auxochromes, effect of structure on absorption characteristics, basics of ORD and CD and emission spectroscopy.

Unit 3

IR spectroscopy - intra and intermolecular hydrogen bonding, effect of concentration and temperature, Fourier transform IR, group frequencies, fundamental frequencies and overtones, Fermi Resonance.

Unit 4

Spectroscopy - experimental aspects, FT NMR, factors influencing sensitivity and resolution, applications of chemical shift and spin-spin coupling, analysis of spin systems, Karplus equation and conformational analysis; factors affecting coupling constants, NMR of carbon-13, brief introduction to NMR of other biologically relevant nuclei. DEPT analysis and brief introduction to correlation spectroscopy (COSY, HMBC and HSQC only).

Unit 5

Mass spectrometry - high resolution mass spectrometry, soft ionization techniques, MS/MS data, application of GC-MS and LC-MS data, determination of molecular structure on the basis of mass spectral data.

Problems based on combined application of various spectroscopic techniques.

CHE 2201 ANALYTICAL CHEMISTRY

(2 Credit)

CORE

32 Hours

Unit 1

Evaluation of analytical data, significant figures. Precision- Standard deviation, coefficient of variation – statistical treatment of data-students T test, rejection of suspected value, Q test.

Classical methods of Analysis, Titrimetry – Theory of indicators- Gravimetry- Theory of complexometric titrations-metal-ion indicators Masking and demasking-Applications of Complexometric Titrations.

Unit 2

Separation Techniques. Distribution law-Liquid-liquid extractions, synergistic extraction. Countercurrent extraction, super critical fluids, Electrophoresis- theory and applications.

Chromatography-classification-column-paper and thin layer chromatography. HPLC- Outline study of instrument modules. Ion – exchange chromatography-Theory. Important applications of chromatographic techniques. Gel Permeation Chromatography.

Unit 3

Gas chromatography – basic instrumental set up-carriers, columns, detectors and comparative study of TCD, FID, ECD and NPD. Qualitative and quantitative studies using GC, Preparation of GC columns, selection of stationary phases of GLC, CHN analysis by GC. Super Critical Fluid Chromatography.

Unit 4

Radiochemical Methods in Analysis – isotopic dilution analysis-Activation analysis, Radiometric titrations- Applications.

Thermal methods of Analysis TG, DTA and DSC - Instrumentation and Theory – Factors affecting TGA - effect of atmosphere on DTA. TG of copper sulphate pentahydrate and

calcium oxalate monohydrate. Application of thermal methods for identification of substances.

Unit 5

Spectrophotometric Analysis - UV-VIS and IR Spectrophotometry. Basic instrumentation for UV-Vis and IR spectrophotometry-single beam and double beam instruments, FT-IR, Fundamental laws of photometry- deviations from Beers law - photometric accuracy-relative photometric error. – Simultaneous determination of two components-.

CHE 2202 Inorganic Chemistry-II

(3 Credit)

48 Hours

Unit 1

Splitting of d orbitals in different crystal fields such as octahedral, tetragonal, square planar, tetrahedral, trigonal bipyramidal and square pyramidal fields. Energy levels of d orbitals in crystal fields of different symmetries crystal field stabilization energy and its calculations. Thermodynamic effects of LFSE. Factors affecting the splitting parameter. Spectrochemical series. Molecular orbital theory based on group theoretical approach and bonding in metal complexes. σ and π bondings in complexes. MO diagrams of complexes with and without π bonds. Effect of π bond on the stability of σ bond. Nephelauxetic series.

Unit 2

Electronic Spectra of complexes: Term symbols of d^n system, Racah parameters, splitting of terms in weak and strong octahedral fields. Correlation diagrams for d^n and d^{10-n} ions in octahedral and tetrahedral fields (qualitative approach), d-d transition, selection rules- effect of spin-orbit coupling Orgel diagrams- splittings for d^1 , d^9 and high spin d^4 and d^6 , splittings for d^2 , d^3 , d^8 and high spin d^7 (ii) Tanabe-Sugano diagrams- spectra of d^7 , d^5 and low spin d^6 complexes. Calculation of Dq , B and β (Nephelauxetic ratio) values. Spectra of complexes with lower symmetries. Jahn Teller effect and their consequences on the nature of the electronic spectra. Charge transfer spectra electronic spectra of lanthanide and actinide complexes

Unit 3

Types of magnetic behaviour, magnetic susceptibilities, Pascal's constants, paramagnetism in experimental simple systems where $S = \frac{1}{2}$, van Vleck's equation, its derivation and its applications. Spin-orbit coupling and susceptibility of transition metal ions and rare earths; magnetic moments of metal complexes with crystal field terms of A, E and T symmetry, T.I.P., intramolecular effects, antiferromagnetism and ferromagnetism of metal complexes, super paramagnetism. High and low spin equilibria. Magnetic properties of lanthanides and actinides

Unit 4

Electronic paramagnetic resonance spectroscopy: Electronic Zeeman effect, Zeeman Hamiltonian and EPR transition energy. EPR spectrometers, presentation of spectra. The effects of electron Zeeman, nuclear Zeeman and electron nuclear hyperfine terms in the Hamiltonian on the energy of the hydrogen atom. Second order effect. Hyperfine splittings in isotropic systems, spin polarization mechanism and McConnell's relations Anisotropy in g-value, EPR of triplet states, zero field splitting, Kramer's rule, survey of EPR spectra of first row transition metal ion complexes.

Unit 5

Thermodynamic and kinetic stability. Kinetics and mechanism of nucleophilic substitution reactions in square planar complexes. Mechanism of entering and other leaving groups and trans effect. Kinetics and mechanism of octahedral substitution.- Dissociative and associative mechanisms, base hydrolysis, Racemization reactions, Trans effect, trans effect series, and theories of trans effect Electron transfer reactions-outer sphere mechanism-Marcus theory, inner sphere mechanism.

CORE

CHE 2203 ORGANIC CHEMISTRY II

(Reactions & Mechanisms)

(2 Credit)

32 Hours

Unit 1

Mechanisms of Nucleophilic, Electrophilic and free radical substitution reactions on aliphatic carbons (saturated and unsaturated): Role of substrate structure, nature of reagents, nature of solvents and stereochemistry on the outcome of these reactions. Neighbouring group participation.

Unit 2

Mechanisms of polar and nonpolar additions and eliminations (excluding pericyclic reactions): Addition and elimination via free radical intermediates, E2, E1 and E1CB mechanisms, Orientation and stereochemistry in E2 eliminations. Pyrolytic syn eliminations, α - eliminations, elimination vs. substitution

Unit 3

Substitutions on aromatic carbon: Mechanism of electrophilic, nucleophilic and free radical substitutions. Synthetic applications.

Unit 4

Rearrangements involving electron deficient carbon and nitrogen. Mechanism of the following rearrangements: Wagner-Meerwein, Pinacol, Demjanov, dienone-phenol, Favorskii, Wolff, Hofmann, Curtius, Lossen, Schmidt, Beckmann, benzidine, and Hofmann-Löffler rearrangements. Fritsch-Buttenberg-Wiechell rearrangement, Corey-Fuchs reaction, Seyferth-Gilbert homologation, Grubbs catalysts and olefin metathesis.

Unit 5

Photochemistry: Unimolecular and bimolecular processes in the excited states, mechanism of important photochemical reactions, Paterno-Buchi reaction, Norrish Type I and Type II fragmentation, di- π -methane rearrangement, Barton reaction, photochemistry of arenes, cyclohexadienones and furanones, nitrocompounds.

CHE 2204 ORGANIC CHEMISTRY III*(Reagents and Synthesis)***(2 Credit)****32 Hours****Unit 1**

Reagents for oxidation and reduction: PCC, activated DMSO oxidations, osmium tetroxide, selenium dioxide, singlet oxygen, peracids, hydrogen peroxide, periodic acid, lead tetraacetate., Woodward and Prevost hydroxylation, Sharpless asymmetric epoxidation. Catalytic hydrogenations (heterogeneous and homogeneous), metal hydride reduction, Birch reduction, hydrazine and diimide reduction.

Unit 2

Synthetic applications of organometallic and organo-nonmetallic reagents: Reagents based on chromium, nickel, palladium, silicon, and boron, Gilman's reagent, phase transfer catalysts, hydroboration reactions, synthetic applications of alkylboranes.

Unit 3

Chemistry of carbonyl compounds: Reactivity of carbonyl groups in aldehydes, ketones, carboxylic acids, esters, acyl halides, amides. Substitution at carbonyl carbon, mechanisms of ester hydrolysis, Substitution at α -carbon, aldol and related reactions, Claisen, Darzen, Dieckmann, Perkin, Prins, Mannich, Stork-enamine reactions. Conjugate additions, Michael additions and Robinson annulation. Reaction with phosphorous and sulfur ylides.

Unit 4

Protecting groups, functional group equivalents, reversal of reactivity (Umpolung), Chemistry of Nucleophilic Heterocyclic Carbenes (NHCs)

Unit 5

Synthetic strategies: Introduction to retrosynthesis, strategic bond analysis, synthesis of longifolene, Corey lactone, Djerassi Prelog lactone

All students to give a presentation ($1/2$ hr.) of a multistep synthesis.

CHE 2205 PHYSICAL CHEMISTRY II

(3 Credit)

CORE

48 Hours

Unit 1 Statistical Thermodynamics 1

Thermodynamic probability, microstate and macrostate, entropy and probability, most probable distribution, residual entropy and its calculation. Maxwell - Boltzman statistics. Derivation of Maxwell's distribution of molecular velocities from Maxwell -Boltzman distribution law. Effect of temperature on distribution. Calculation of most probable velocity, average and mean square velocity, components of velocity. Mean free path, Effusion and diffusion, thermal conductivity and viscosity of gases.

Unit 2 Statistical Thermodynamics 2

Partition function and its relation to thermodynamic properties, Translational , rotational and Vibrational partition function. Molecular partition function for delocalized systems, calculation of equilibrium constant using partition functions. Heat capacity of gases, Anomalous heat capacity of H₂ Heat capacity of solids: Dulong - Petits law, Einstein's theory and its modification, Debye's theory of heat capacity of solids.

Unit 3 Statistical Thermodynamics 3

Quantum statistics, Bose - Einstein statistics, Fermi - Dirac statistics, Comparison of Maxwell - Boltzman, Bose-Einstein and Fermi - Dirac Statistics, Dilute Systems. Application of Bose -Einstein Statistics, Gas degeneration, Application to liquid helium, Bose Einstein Condensation. Application of Fermi -Dirac Statistics to electrons in metals, Extreme Gas Degeneration, Electron gas in metals and its contribution to pressure and heat capacity.

Unit 4 Statistical Thermodynamics 4

Partition function for systems of dependent particles, Configurational integral and configurational partition function. Imperfect gas, Van der waals equation and Virial

equation of state, Evaluation of the first virial coefficient. Condensed state, Cluster integrals, Communal entropy.

Unit 5 Linear Non-equilibrium thermodynamics

General theory, Local entropy production, balance equation for concentration. Energy conservation in open systems. Entropy balance equation. Forces and Fluxes, Steady state and local equilibrium conditions. Linear phenomenological laws. Phenomenological coefficient, Systems with heat, matter and electrical transport, Onsager Reciprocal relation, Application to Diffusion -Thermal diffusion, Thermal Osmosis and electrokinetic effects, Soret Coefficient, Seebeck effect.

Unit 6 Order through Fluctuations

Nonlinear thermodynamics- Far from equilibrium systems- entropy production- stability of non-equilibrium stationary states- linear stability analysis. Dissipative structures- constructive role of irreversible processes- loss of stability, bifurcation and symmetry breaking. Breaking of Chiral symmetry and life- chemical oscillations. Turing structures and propagating waves. Structural instability and biochemical evolution.

CHE 2206 ORGANIC SPECTROSCOPY

(2 Credit)

CORE

32 Hours

Unit 1: Ultraviolet-Visible Absorption and Emission and Chiroptical Spectroscopy

Energy levels and selection rules, Woodward-Fieser and Fieser-Kuhn rules, estimation of λ_{max} of substituted aromatic ketones, aldehydes and acids.

Influence of substituent, ring size and strain on spectral characteristics. Solvent effect, Non-conjugated interactions. Spectral correlation with structure. ; Brief Introduction to emission spectroscopy ORD, CD, Octant rule, axial haloketone rule, Cotton effect.

Unit 2: Infrared Spectroscopy

Fundamental vibrations, overtones, Fermi Resonance, Advantages of FT technique, Characteristic regions of the spectrum. Influence of substituents, ring size, hydrogen bonding, vibrational coupling, hybridization and field effect on frequency. Determination of Stereochemistry.

IR spectra of chemical classes including aminoacids.

Unit 3: Nuclear Magnetic Resonance Spectroscopy

Magnetic nuclei with special reference to ^1H and ^{13}C nuclei. Chemical shift and shielding/deshielding, relaxation processes, chemical and magnetic non-equivalence, local diamagnetic shielding and magnetic anisotropy. Proton and ^{13}C NMR scales, characteristics of ^{13}C as a nucleus.

Spin-spin splitting, AX, AX₂, AX₃, A₂X₃, AB, ABC, AMX type coupling, First order and non-first order spectra, Pascal's triangle, coupling constant, mechanism of coupling, Karplus curve, quadrupole broadening and decoupling, diastereomeric protons, virtual coupling, long range coupling effects, NOE, coupling with other nuclei.

Simplification non-first order spectra to first order spectra, shift reagents-mechanism of action, spin decoupling and double resonance, Chemical shifts and homonuclear/heteronuclear couplings, the basis of heteronuclear decoupling.

2D NMR and COSY, HMBC, HMQC

Polarization transfer. Selective Population Inversion (qualitative description only), DEPT, sensitivity enhancement and spectral editing.

Unit 4: Mass Spectrometry

Molecular ion, ion production methods (EI). Soft ionization methods: FAB, CA, MALDI, PD, Field desorption electrospray ionization, HRMS and formula mass, Fragmentation patterns, nitrogen and ring rules, Rule of thirteen, McLafferty rearrangement, Applications. HRMS, MS- MS, LC-MS, GC-MS.

Unit 5: Structural Elucidation Using Spectroscopic Techniques

Identification of structures of unknown organic compounds based on the data from UV-Vis, IR, ¹HNMR and ¹³CNMR spectroscopy.

CHE 2207 ORGANIC CHEMISTRY LAB**(2 Credit)**

Part 1 : General methods of separation and purification of Organic Compounds such as:

Solvent extraction

TLC and paper chromatography

Column Chromatography

Part 2: Separation and Identification of the components of organic binary mixtures.

Part 3 : Preparation of Organic compounds by Multistep reactions.*

Part 4 : Spectral interpretation of organic compounds, using UV-Vis and FTIR

Part 5 : Drawing the structures of organic molecules and reaction schemes by Chemdraw.

*Progress of the reactions should be followed by spectroscopic and chromatographic methods (UV-Vis, TLC, GC, HPLC, etc.,)

Computational Organic Chemistry Practicals

Construction of z-matrices

Structure drawing

Molecular Mechanics Calculations

Mapping molecular electrostatic potential

Calculation of Hückel Molecular Orbitals

Applications of Semi-Empirical and Ab Initio methods in calculating molecular orbitals and geometry optimization.

ELECTIVE

CHE 2208 INTRODUCTION TO MATERIALS CHEMISTRY

(2 Credit)

32 hours

Unit 1

Chemistry of Materials. Historical perspectives – strategies for the design of new materials- a critical thinking approach. Ionic and covalent solids. Molecular and metallic solids. Amorphous and crystalline materials. Crystalline state. Structural organization of crystalline solids-theories of bonding. Crystal structures. Imperfections in crystal structures. Amorphous materials – glasses and ceramic solids. Structural organization of amorphous solids. Traditional ceramics. Synthetic high performance ceramics. Crystal structure of ceramics.

Unit 2

Metals and alloys. Structural and bonding theories of metals. Alloys -ferrous alloys – phase behavior of ferrous alloys. Behaviour of binary alloys. Intermediate compounds and intermediate phases. Nonferrous metals and alloys. Shape memory alloys. PZT materials. Optical, electrical and magnetic properties of metallic materials.

Unit 3

Semiconductor materials- properties and types of semiconductors. Structure and Bonding of semiconductor materials. Silicon based semiconductors. II-VI (wide band gap) and III-V (narrow band gap) compound semiconductors. Electrical, optical and magnetic properties of semiconductor materials. Preparation and properties of ZnO, ZnS, CdS, CdTe, Ga-As, In-S, Cu-In-S. Application in photovoltaic devices

Unit 4

Polymer Materials- classification and nomenclature of polymers. Methods of Polymerization. Dendritic and cascade polymers. Polymers via Click Chemistry. Properties of polymers. Plastics and elastomers. Viscoelastic behavior. Rubber like

elasticity. Crystalline and amorphous polymers. Glass transition temperature and crystalline melting. Polymer composites- polymer matrix composites.

Unit 5

Nanomaterials. Materials in the nanodomain. Zero, one and two dimensional materials. Particle size dependent change in properties of materials. Metals in the nanodomain. Gold and silver nanoparticles. Preparation, properties and applications. Core shell structures. Semiconductor nanoparticles. Quantum dots. ZnO, ZnS, CdS and CdSe quantum dots. Electrical and optical properties. Nano domains of Carbon-fullerenes, carbon nanostructures, graphene.

Unit 6

Characterization of Materials. Optical Microscopy- Principles, instrumentation and application of confocal raman microscopy, SPM/STM. Electron microscopy- SEM, FESEM, TEM. Principles, instrumentation and applications. Surface and core level techniques- Photoelectron spectroscopy- X-Ray and UV. Thermal methods- TG/DTG, DTA, DSC, DMA. X-Ray Diffraction

ELECTIVE

CHE 2209 STEREOCHEMISTRY - II

(2 Credit)

32 Hours

Unit 1

Reaction Mechanisms and Conformational Effects on Reactivity - Ester Hydrolysis, Alcohol Oxidations, S_N2 Reactions, Elimination Reactions, Epoxidation by Intramolecular Closure of Halohydrins, Epoxide Openings (S_N2), Electrophilic Additions to Olefins, Rearrangement Reactions, Conformational and Stereoelectronic Effects on Reactivity.

Unit 2

Pericyclic Reactions. Stereochemistry of Diels-Alder Reaction. Substituent Effect on Reactivity, Regioselectivity and Stereochemistry. Orbital Symmetry Basis for the Stereospecificity of Electrocyclic Reactions. Orbital Description of Sigmatropic Rearrangements. Orbital Correlation Diagram.

Unit 3

Enantiomers and Diastereomers. Resolution Methods. Stereospecific and Stereoselective Synthesis, Introduction to Asymmetric Synthesis, Principles, General strategies, Chiral Pool strategy, Chiral Auxiliaries-Diels Alder Reaction, Chiral Reagents – Binol Derivatives of LiAlH₄, Chiral Catalysts – CBS Catalyst.

Unit 4

Stereoselective Nucleophilic Additions to Acyclic Carbonyl Groups. Cram's Rule. Felkin-Ahn Model. Effect of Chelation on Selectivity. Diastereoselectivity in Aldol Reactions. Stereoselective Reactions of Acyclic Alkenes. The Houk Model.

Unit 5

Stereoselective Reactions of cyclic compounds. Reactions on Small Rings. Stereochemical Control in Six Membered Rings. Stereochemistry of Bicyclic Compounds. Reactions with Cyclic Intermediates/Transition states.

ELECTIVE

CHE 2210 Crystallography

(2 credit)

32 Hours

Unit 1

Crystals, Obtaining crystals, Identification of crystal systems, cell parameters, asymmetric unit, unit cell, faces of crystal, Miller indices, Crystal symmetry, Space groups (symmorphic and non-symmorphic systems) , reciprocal lattice, Properties of a crystal

Unit 2

Significance of crystal structure determination by using X-rays as source, X-ray diffraction method, Bragg's law

Unit 3

Stages involved in crystal structure analysis by X-ray diffraction, experimental set up for single crystal X-ray analysis.

Unit 4

Structure solution. Patterson and direct methods. Refinement techniques, R factor or discrepancy index

Unit 5

Crystal growth techniques – Solvothermal synthesis, Diffusion method, Slow evaporation method, Microwave Irradiation method, Sonochemical method, Mechanochemical method, Electrochemical method

CHE 2211 BIOANALYTICAL CHEMISTRY

(2 Credit)

32 Hours

Unit 1-Biomolecules

Biomolecules- amino acid, protein, nucleic acid –structures, physical and chemical properties, features and characteristics of major biomolecules, structure-function relationship, significance.

Analyses and quantification of biomolecules- method to detect and quantify biomolecules.

Unit 2-Centrifugation and separation

Principle of centrifugation, concept of RCF, features and component of major types of centrifuge, preparative, differential and density gradient centrifugation, analytical ultra-centrifugation, centrifugation methods for bio analysis. Determination of molecular weight.

Unit 3-Electrophoresis

Electrophoretic techniques- Principles of electrophoretic separation. Types of electrophoresis including paper, cellulose, acetate/nitrate and gel. Electroporation, Pulse field gel electrophoresis- applications in life and health science.

Unit 4-Immunochemical techniques

Radio immune assay (RIA) - principle and applications. Enzyme linked immune sorbent assay (ELISA) principle and applications. Biosensors-applications

Unit 5-Electron microscopy

Transmission and scanning, freeze fracture techniques, specific staining of biological materials.

CHE 2212 Medicinal Chemistry**(2 Credit)****32 hours****Unit I**

Principles of Drug discovery: Introduction to drug discovery. drug discovery without lead – serendipity – Pencillins, Cisplatin, librium (chlordiazepoxide), aspartame as examples. Selection of disease and drug target. Bioassay and Lead discovery. Drugs from natural sources and development.

Case studies of modification of morphine and atropine. Drug metabolism studies: Phase I and Phase II metabolism. Clinical observations: Phase I, Phase II, Phase III, Phase IV trials (Introductory treatment only).

Principles of drug design; agonist, antagonist drugs, Structure pruning technique in drug design (eg. morphine pharmacophore). Development of ranitidine and captopril from lead molecules. Introduction to combinatorial synthesis. Drug resistance and mutation.

Unit II

SAR Studies: Introduction to structure-activity relationship (SAR) studies – (i) Binding role of hydroxyl group, amino group, aromatic ring, double bond, ketones and amides, (ii) Variation of substituents – alkyl substituents, aromatic substituents, extension of structure, chain extension / contraction, ring expansion / contraction, ring variation, ring fusion, Isosteres. (iii) Simplification of the structure, rigidification, conformational blockers. X-ray crystallographic studies. Case studies of oxaminquine (schistosomiasis), sulpha drugs (antibacterial), benzodiazepines (hypnotic).

Unit III

QSAR Studies: Introduction to Quantitative Structure Activity Relationship (QSAR) studies. QSAR parameters – substituent constants – linear and non – linear relationships between ρ and biological activity. Electronic parameters, steric parameters, effect of electronic and steric parameters on lipophilicity. Methods used in QSAR studies – (i) Linear free energy relationship (LFER). Application of Hammett equation. (i) Hansch

analysis – significance of slopes and intercepts in Hansch analysis, (ii) Craig's plot, (iii) Topliss scheme, (iv) Free Wilson model – advantages and disadvantages, (v) Clustet significant analysis (vi) Minimal topological difference method.

Unit IV

Selected Drugs-I (Chiral drugs: Synthesis/production and mode of action):

Introduction to chiral drugs. Eotomer, distomer, eudesmic ratio, three point contact model – Feiffers rule. Synthesis of [S]-Ibuprofen and [S]-Naproxen (non-steroid anti-inflammatory drugs); Digoxin Propranolol, Atenolol and Metoprplol (Cardiovascular drugs); Ramipril and Quinapril (ACE inhibitors); [2S,3S]-Diltiazem (Calcium antagonist) Paroxetine (Serotonin uptake inhibitor); Indanavirsulfate (crixivan, HIV-I protease inhibitor); Lamivudine (3TC, HIV-reverse transcriptase inhibitor), Fexofenadine (H-blocker), thalidomide (immunomodulator), oral contraceptives.

Unit V

Selected Drugs-II: Synthesis/production and mode of action:

Penicillins, cephalosporins, valinomycin, gramicidin, tetracyclins, chloramphenicol, erythromycin, ciprofloxacin, isoniazid, prontosil (Antibacterial agents). Ivermectin (antiparasitic) Aspirin (analgesic), Aciclovir, azidothymidine, saquinavir, ritonavir, oseltamivir (Antiviral agents). Genistein, camptothecin, podophyllotoxin, calicheamicin, tamoxifen, paclitaxel (Anticancer agents). Salbutamol, ephedrine, Phenobarbital, prozac (CNS Drugs). Salvarsan (Antisyphilitic). Lovastatin (cholesterol lowering), cyclosporine (immunosuppressant). Viagra (vascodialator). Methadone (narcotic).

INTERDEPARTMENTAL ELECTIVE

CHE 2213 CHEMICAL INSTRUMENTATION (Credit 2)

Unit I- Separation Techniques

Chromatography basic principle – adsorption and partition chromatography, importance of column technology. Paper, thin layer and column chromatographic methods, Liquid chromatography, normal phase versus reversed phase chromatography. Gas chromatography, theory and equipment, different columns used in GC. Ion exchange chromatography- basic principle. Instrumentation and applications of HPLC, LC-MS, GC-MS.

Unit II- Introduction to Spectroscopy

Basic theory and instrumentation of UV-VIS, IR. Atomic spectroscopy - atomic absorption, atomic emission. Flame emission and atomic absorption spectrometry. Instrumentation for AAS. The flame characteristics. Hollow cathode lamp. Interference in AAS. Application of AAS. Comparison between AAS and AES. ICP AES – Principle and applications.

Unit III- X-ray analysis and electron spectroscopy (surface analysis)

Use of X-ray diffraction in structure determination (both single crystal and powder methods)

Use of SEM, STM, AFM and TEM for the characterization of surfaces (Basics only).

Photo electron spectroscopy- XPS and UPS (principle and applications).

Unit IV- Thermal Methods of Analysis

Principles of TG and DTG, DTA and DSC

Application of TG – quantitative analysis of a mixture of Ca, Sr and Ba, decomposition of $\text{CaC}_2\text{O}_4 \cdot \text{H}_2\text{O}$

Application of DTA – characterization of polymers

Application of DSC – glass transition temperature, crystallinity and crystallization rate

Unit V- Electroanalytical Techniques

Polarography – diffusion current, supporting electrolyte, three electrode system, polarographic maxima. Amperometry – principles and applications – Types of amperometry.

Cyclic voltammetry – principles, applications. Stripping voltammetry.

CHE 2301 INSTRUMENTAL METHODS OF ANALYSIS

(2 Credit)

32 Hours

Unit 1

Electrogravimetry- coulometry- constant current and constant potential coulometry- applications-primary and secondary coulometry – conductance measurement – conductometric titrations. Ion-selective electrodes, ion-selective FET, immobilized enzyme electrodes construction.

Unit 2

Polarography – current – voltage curve. DME-components of polarographic current – supporting electrolyte – polarographic maxima. Half-wave potential-Instrumentation- Applications of Polarography. Pulse and differential pulse polarography- -stripping analysis. Amperometric titrations – Different types. Applications. Cyclic voltammetry- Theory and applications

Unit 3

Flame Emission and Atomic Absorption Spectrometer. Instrumentation of AAS, the flame spectra, flame characteristics. Atomizers used in spectroscopy, Hollow cathode lamp _ Interference in AAS-applications. Advantages of AAS over AES Atomic emission spectroscopy-flame photometry-ICP - Theory, Instrumentation and Applications.

Unit 4

Fluorescence Spectroscopy- Molecular fluorescence and fluorometers: photoluminescence and concentration – electron transition in photoluminescence – Quenching – Fluorescence Sensors -Instrumentation for Fluorescence Spectroscopy

Unit 5

Chemical Analysis of surfaces: Surface preparations-ion scattering spectrometry secondary ion scattering microscopy (SIMS)-Auger electron spectroscopy-ESCA instrumentation and application.

Principles and Applications of SEM, TEM and AFM.

CORE

CHE 2302 INORGANIC CHEMISTRY-III

(3 Credit)

48 Hours

Unit 1

Compounds with transition metal to carbon bonds: classification of ligands, nomenclature, eighteen electron rule; transition metal carbonyls: Metal nitrosyls, cyanides and isocyanides. structure, bonding, spectra, preparation and reactions; transition metal organometallics. Transition metal clusters. Parallels with nonmetal chemistry isolobal analogy.

Unit 2

Metal alkyls, carbenes and carbenes Nonaromatic alkene and alkyne complexes allyl and pentadienyl complexes metallocenes structure of cyclopentadienyl compounds arene complexes, complexes of cycloheptatriene, cyclooctatetraene and cyclobutadiene complexes metal clusters Application of Wade-Mingos-Lauher rules in predicting the structure of organometallic clusters and Jemmis mno rules in predicting the stability of macropolyhedral clusters

Unit 3

Homogeneous catalysis using organometallic compounds: Reactions of organometallic complexes Ligand cone angle oxidative addition, reductive elimination, insertion, nucleophilic and electrophilic attack of coordinated ligands olefin hydrogenation, hydroformylation, Wacker process, Ziegler-Natta polymerisation, cyclo oligomerisation, olefin isomerisation, olefin metathesis, Monsanto acetic acid synthesis, Fischer-Tropsch process, hydrosilylation.

Unit 4

Metal ions in biological systems: heme proteins, hemoglobin, myoglobin, hemerythrin, hemocyanin, ferritin, transferrin, cytochromes and vitamin B12; Iron-sulphur proteins: rubredoxin, ferredoxin and model systems.

Copper enzymes, superoxide dismutase, cytochrome oxidase and ceruloplasmin; Coenzymes;

Molybdenum enzyme: xanthine oxidase; Zinc enzymes: carbonic anhydrase, carboxy peptidase

and interchangeability of zinc and cobalt in enzymes; Vitamin B12 and B12 coenzymes; Iron storage, transport, biomineralization and siderophores, ferritin and transferrins.

Unit 5

Applied bioinorganic chemistry, anti-cancer agents–cisplatin, radiopharmaceuticals (Tc), diagnostic (Gd in MRI) and therapeutic agents. Boron neutron capture therapy of cancer.

CORE

CHE 2303 ORGANIC CHEMISTRY IV

(Natural Products)

(4 Credit)

64 hours

Unit 1

Nomenclature and general characteristics of heterocyclic compounds, Study of three and four-membered ring heterocycles containing one heteroatom.

Unit 2

Heteroaromatic compounds (five and six-membered rings) containing one or two heteroatoms. Fused ring compounds: indole, quinoline, isoquinoline, coumarin, flavone, purine and pyrimidine bases present in nucleosides.

Unit 3

Terpenoids: classification, biosynthesis; structure elucidation and synthesis of abietic acid; Steroids: classification, biosynthesis, structure of cholesterol, conversion of cholesterol to progesterone, androsterone and testosterone. Fattyacids, biosynthesis. Prostaglandins classification, structure, biosynthesis and synthesis.

Alkaloids - classification, isolation, structure elucidation based on degradative reactions (quinine and atropine). Biosynthesis of quinine and papaverine.

Unit 4

Carbohydrates: Structure of ribose, glucose, fructose, maltose, sucrose, lactose, starch cellulose and cyclodextrins, Preparation of alditols, glycosides (O, C, and N), deoxysugars. Synthesis of Vitamin C from glucose. Structure and synthesis of nucleic acids, genetic code, Recombinant DNA, biosynthesis of shikimic acid.

Unit 5

Aminoacids, peptides and enzymes: Synthesis of aminoacids - Strecker and azalactone synthesis, enantioselective synthesis of aminoacids, reactions of aminoacids. Structure of proteins, introduction to enzymes and coenzymes with special reference to the function of chymotrypsin, NAD, thiamine, pyridoxal. In vitro and in vivo synthesis of peptides, solid phase synthesis.

CORE

CHE 2304 PHYSICAL CHEMISTRY III

(3 Credit)

48 Hours

Unit 1 Chemical Kinetics 1

Reaction rates and order of reactions, determination of order of reactions, complex reactions, reversible, consecutive and concurrent reactions. Reactions of variable order-steady state treatment, free radical reactions-the Rice Herzfeld Mechanism. Fast reactions and relaxation methods. The reaction mechanism and molecularity. Theories of unimolecular reaction and termolecular reaction.

Unit 2 Chemical Kinetics 2

Reaction Dynamics. Theories of reaction rates. Arrhenius equation, Collision cross section and reaction cross section. Collision theory. Potential energy surfaces and reaction coordinate. Transition state theory. Comparative study of the theories of reaction rates. Thermodynamic treatment of Reaction rates.

Molecular beam methods : determination of reaction cross section.stripping and rebound mechanism. Introduction to femtochemistry.

Kinetics of reactions in solution. Diffusion controlled reactions, Effect of solvent on rates of reactions, ionic reactions and effect of ionic strength. Effect of pressure on velocity of gas reactions.

Unit 3 Chemical Kinetics 3

Catalysis and inhibition, Homogeneous catalysis, acid base and enzyme catalysis. Heterogeneous Catalysis. Mechanism of heterogeneous catalysis. Eley-Rideal and Hinshelwood mechanisms. Photochemical reaction kinetics; steady state treatment of photochemical reactions, $H_2 - Br_2$ and $H_2 - Cl_2$ reactions. Quantum yield. Quenching of fluorescence, Stern - Volmer equation. Oscillating chemical reactions. Semenov-Hinshelwood theory of chain reactions and explosions.

Unit 4 Surface Chemistry 1

Different types of interfaces- surface tension of solutions, surface excess. Thermodynamics of surfaces. The Gibbs equation and its derivation. Surface films. Surface pressure and surface potential. Lippmann equation Adsorption by solids. The Langmuir isotherm its kinetic and statistical derivation. The Freundlich equation (no derivation). Adsorption from solution

Unit 5 Surface chemistry 2

Multilayer adsorption- the BET isotherm-its kinetic derivation. Measurement of surface area, Heat of adsorption and its determination. Colloids, their preparation and purification, stability of colloids, Zeta potential and its determination- electrokinetic phenomena Electrophoresis, Electroosmosis, Sedimentation and streaming potential ; Donnan membrane equilibrium and its applications

Unit 6 Surface chemistry 3

Colloidal Surfactants, Micelles, HLB number. Stabilising action of surfactants, Practical importance of surfactants. Langmuir- Blodgett films. Morphological studies. Sol –gel process- preparation of ordered microporous and mesoporous materials by sol-gel process. Preparation of perovskites and spinels by Sol-gel process. Sol-gel process and nanomaterials.

CHE 2306 SOLID STATE CHEMISTRY

(2 Credit)

32 Hours

Unit 1

Band theory of solids- energy bands, conductors and non-conductors, intrinsic semiconductors, extrinsic semiconductors, Hall effect.

Unit 2

Stoichiometric Defects: Equilibrium concentration of point defects in crystals - Schottky defects, Frenkel defects; The photographic process - light sensitive crystals, mechanism of latent imageformation, lithium iodide battery. Non-Stoichiometric Defects: Origin of non-stoichiometry, consequences of non-stoichiometry; Equilibria in non-stoichiometric solids, Color centers: F-centre, electron and hole centre; colour centre and information storage.

Unit 3

Electrical properties; conductivity in pure metals; superconductivity; basics, discovery and high T_c superconductors magnetic properties; ferromagnetic and antiferromagnetic materials

Unit 4

Optical properties; photoconductivity, photovoltaic effect, applications, luminescence. Electrical properties: dielectric properties, piezo-electricity, Ferro electricity. Lasers and their applications in chemistry.

Unit 5

Preparative methods: Solid state reaction, chemical precursor method, co-Precipitation, sol-gel, metathesis, self-propagating high temperature synthesis, ion exchange reactions, intercalation/deintercalation reactions; hydrothermal and template synthesis; , preparation of thin films - electrochemical methods, chemical vapour deposition; Crystal growth - Bridgman & Stokbarger methods, zone melting.

Characterization of Solids: Crystal growing; Data collection, data reduction, refinement and structure solution of some compounds

CHE 2307 INDUSTRIAL CATALYSIS
(2 Credit)

ELECTIVE

32 Hours

Unit 1

Adsorption and catalysis – adsorption and reaction rate – strength of adsorption bond and catalysis – adsorption equilibrium and catalysis, kinetics of heterogeneous catalysis: diffusion steps neglected – unimolecular reactions – bimolecular reactions – Langmuir-Hinshelwood and Eley-Rideal mechanism, kinetics of heterogeneous catalysis: diffusion controlling – mechanism of diffusion – diffusion and reaction in pores – selectivity and diffusion, electronic factors in catalysis by metals, electronic factors in catalysis by semiconductors, geometric factors and catalysis.

Unit 2

Surface area and porosity measurement – measurement of acidity of surfaces; Support materials – preparation and structure of supports – surface properties, preparation of catalysts – introduction of precursor compound – pre-activation treatment – activation process. General methods of synthesis of zeolites, mechanism of nuclear formation and crystal growth, structures of some selected zeolites – zeolites A, X and Y, pentasils – ZSM-5, ZSM-11, shape selective catalysis by zeolites.

Unit 3

Deactivation of catalysts, classification of catalyst deactivation processes, poisoning of catalysts, coke formation on catalysts, metal deposition on catalysts, sintering of catalysts, Regeneration of deactivated catalysts, feasibility of regeneration, description of coke deposit and kinetics of regeneration.

Basic concepts in phase transfer catalysis – phase transfer catalyzed reactions – basic steps of phase transfer catalysis – effect of reaction variables on transfer and intrinsic rates – outline of compounds used as phase transfer catalysts

Unit 4

Enzymes – an introduction to enzymes – enzymes as proteins – classification and nomenclature of enzymes – structure of enzymes – how enzymes work – effect on reaction rate – thermodynamic definitions – catalytic power and specificity of enzymes – optimization of weak interactions between enzyme and substrate in the transition state – binding energy, reaction specificity and catalysis – specific catalytic groups contributing to catalysis.

Unit 5

Oil based chemistry; catalytic reforming; catalytic cracking; paraffin cracking; naphthenic cracking; aromatic hydrocarbon cracking; isomerization; hydrotreatment; hydrodesulphurization; hydrocracking; steam cracking; hydrocarbons from synthesis gas; Fisher-Tropsch process, Mobil process for conversion of methanol to gasoline hydrocarbons. Catalysis for environmental protection, removal of pollutants from exhausts, mobile and static sources.

CHE 2308 MICROBIAL TECHNOLOGY
(2 Credit)

ELECTIVE

32 Hours

Unit 1

Industrial microorganisms: differentiation between prokaryotes and eukaryotes; General characteristic, structures, nutrition, growth, reproduction and economic importance of bacteria, Economic importance of fungi and acinomyces

Prevention and control of microorganisms- Control by physical and chemical agents-

Unit 2

Fermentation techniques: Screening procedures; preservation and maintenance of industrial microorganisms; batch, fed batch and continuous fermentation. Fermentor.

Down stream processing- Introduction, separation- filtration, centrifugation, flocculation and flotation; disintegration of cells-mechanical and nonmechanical methods; extraction.

Concentration methods-evaporation, membrane filtration, ion exchange. Purification-chromatography, drying and crystallization.

Unit 3

Manufacture of Beer, Production of alcohol by fermentation.

Manufacture of dairy products- Butter, Cheese. Fermented milk beverages- kefir, kumiss. Yoghurt. Microbial production of antibiotic- Penicillin, streptomycin.

Unit 4

Microbial production of Organic acids and Amino- Citric and acetic acid; glutamic acid, lysine. Microbial production of vitamins- vitamin B12 and Riboflavin

Microbial transformation of steroid and sterol.

Unit 5

Production and purification of microbial enzymes- protease, amylases, lipases and their industrial application. Enzyme immobilization- various methods of immobilization and application of immobilized enzymes.

CHE 2309 Advanced Photochemistry
(2 Credit)

ELECTIVE

32 Hours

Unit 1

Energy Transfer-Theories of Energy Transfer – Photosensitization of Organic and Inorganic Molecules – Singlet Oxygen – Methods of singlet oxygen generation and Detection – Chemistry of Singlet Oxygen – Photodynamic Therapy of Cancer

Unit 2

Photoinduced Electron Transfer – Theory of Electron transfer – Circumventing Back Electron transfer – Photoinduced Electron transfer reactions of Organic and Inorganic Molecules – Photosynthesis –

Unit 3

Photochemistry and Photophysics of Semiconductors – Semiconductor Photocatalysis and applications. Atmospheric photochemistry.

Unit 4

Photochemistry and Advanced Materials - Artificial Solar Energy Harvesting – Photochemical Splitting of Water – Dye sensitized solar cells - Grätzel Cell - Bulk heterojunction devices for solar energy harvesting - Organic light emitting devices.- Photoresists – Photolithography – Photochromism – Photonic Materials and Lasers

Unit 5

Photochemistry in Practice – Radiometry and Actinometry – Principles of Radiometry and radiometers – Actinometry – Quantum Yields – Light Sources – Optical Materials and Filters – Photochemical Reactors

CHE 2310 INTRODUCTION TO COMPUTATIONAL CHEMISTRY

(2 Credit)

32 hours

Unit 1

Tools and philosophy of computational chemistry. Fundamental molecular forces-the dynamic equation – solving dynamic equation. Separation of variables- separating time and space variables – separating nuclear and electronic variables. Separation of variables and hybrid modeling. Quantum chemical description of the system – hydrogen and helium atoms. Many electron wave functions- second quantization. Reduced density matrices- Resolvents and Green's functions. Potential energy surfaces-Born – Oppenheimer approximation- geometry optimization- stationary points

Unit 2

Molecular mechanics and force fields-the force field energy. Force field parameterization- parameter reductions- universal force fields Transferability of force fields. Calculation of energy and geometry of molecules- treatment of delocalized pi-systems- coordinate space for geometry optimization-optimization algorithm. Hybrid MM methods-mechanical embedding- IMOMM, IMOMO, ONIOM. Polarization embedding. Deductive Molecular mechanics – bridging with quantum chemical methods. Stereochemistry and VSPER theory

Unit 3

Methods of molecular structure- Hybrid perspective.– pseudo potential and valence approximation. Hartree- Fock approximation- HF-Roothaan's theorem and semi empirical methods- all valence semi empirical methods- pi- approximation. Non HF- R semi empirical methods- linear scaling semi empirical methods for organic molecules – SLG approximation- semiempirical methods for transition metal complexes. Effective Hamiltonian for the crystal field

Unit 4

Electronic structure methods-independent particle models- SCF methods- energy of a Slater determinant- Koopman's theorem. The Basis set approximation- Restricted and unrestricted Hartree Fock- NDDO, INDO, CNDO methods. Parameterization- MINDO, AM1, PM3. Extended Huckel theory. PM. Electron correlation – excited Slater determinants- configuration interaction. The UHF dissociation and the spin contamination problem. Many body perturbation theory- Moller-Plesset perturbation theory. Coupled Cluster theory. Basis sets- Slater and Gaussian type orbitals. Even and well tempered Basis sets. Contracted Basis sets. Construction of the Z- matrix

Unit 5

Density Functional methods- orbital free DFT. Kohn – Sham theory (LCAO equations). Reduced density matrix methods. Exchange and correlation holes. Exchange- correlation functional. Linear scaling techniques. Pauli and Thomas – Fermi models. Hohenberg-Kohn theorems. Numerical integration (Quadrature). Custom and Hybrid functional. Local density approximations. Beyond the local density approximation. The Becke exchange correction . The Lee-Yang – Paar Correlation Potential

Unit 6

Determination of molecular properties using molecular mechanics, ab initio, semi empirical and DFT methods. Wave function analysis- population analysis. Geometry, Total energy, Dipole moment, vibrational frequency, Chemical Shifts. Determination of orbital energy gap – electronic spectral transitions. Application to polymers- periodic boundary condition. Determination of polarizability and hyperpolarizability of organic molecules and polymers. Interaction with solvents and solvent effects- Onsager model. Solvatochromism.

CHE 2311 POLYMER TECHNOLOGY
(2 Credit)

ELECTIVE

32 Hours

Unit 1

Classification of elastomers. Manufacture, properties, processing, compounding, vulcanisation and applications of SBR, polybutadiene and polyisoprene rubber. Comparison of synthetic polyisoprene with NR. Manufacture, properties, processing, compounding, vulcanisation and applications of EVA, Polyacrylate rubbers, Polysulphide rubbers and Polyurethanes.

Unit 2

Manufacture, properties, processing, compounding, vulcanisation and applications of EPDM, Butyl rubber, Nitrile rubber, Neoprene rubber, Hypalon rubber, Silicone rubber and Fluorocarbon rubber.

Unit 3

Brief history of plastics - Advantages and disadvantages - thermoplastics and thermosets. Manufacture of monomers, polymerization and structure of poly vinyl chloride, characterization of commercial polymers, compounding ingredients, PVC formulations. Some simple moulding techniques- Injection moulding, Compression moulding, and Blow moulding.

Unit 4

Manufacture of phenolic resins, preparation of phenol formaldehyde moulding powders, applications of PF resin. Urea formaldehyde resin and applications of UF resin. Adhesives- adhesive bonding-advantages-adhesive classification - basic terminology-theories of adhesion-wettability -performance of adhesives -shear, peel and cleavage properties-factors affecting adhesive performance. Structural adhesive -types -epoxy, urethane, acrylic, phenolic and high temperature and PVC plastisol types, advantages and disadvantages.

Unit 5

Mechanical properties of plastics and rubber – tension, compression, shear, flexural, tear strength, dynamic stress- strain, hardness, impact strength, resilience, abrasion resistance, creep and stress relaxation, compression set, dynamic fatigue, ageing properties etc. Thermal properties– specific heat, thermal conductivity, thermal expansion, heat deflection temperature etc. Electrical properties– resistivity, dielectric strength, dielectric constant etc. Optical properties – transparency, refractive index, haze, gloss etc.

ELECTIVE

CHE 2312 CHEMISTRY OF CARBOHYDRATES
(2 Credit) **32 Hours**

Unit I

Definition and classification of sugars, nomenclature, aldoses and ketoses, configuration of (+)- glucose: the Fischer proof, ring structures and conformation, mutarotation, anomericity, naturally occurring monosaccharides, oligosaccharides and polysaccharides, three-dimensional structure of macromolecular carbohydrates. Introduction to Inositol and its derivatives and their commercial applications.

Unit 2

Methods for isolation, purification and structural analysis, complete and partial hydrolysis, methylation analysis, Smith degradation, color tests and methods for estimation of carbohydrates.

Unit 3

Chemical reactions of carbohydrates, oxidation, reduction, formation of derivatives, glycosides, ethers, esters and cyclic acetals, modern chemical transformations, methods for the formation and cleavage of O-glycosidic bond, use of protecting groups, Formation of acetals between diols, Regioselective opening and deprotection of acetals, Esterifications, Ester deprotections, Alkylations, Silylations, Nitrogen protections. Conversion of glucose to ascorbic acid.

Unit 4

Chemical and enzymatic synthesis of oligosaccharides, carbohydrates as chiral synthons for natural products synthesis. Nucleophilic Displacement on Carbohydrate Rings.

Unit 5

Carbohydrate biopolymers, animal glycoproteins, blood-group substances, plant and algal glycoproteins, proteoglycans and glycosaminoglycans, glycolipids, glycoconjugates, carbohydrate components of nucleic acids and antibiotics.
